Bachelor's degree, Telecommunications Engineering · (2015 - 2018)

### Secondary Technical School, Poprad

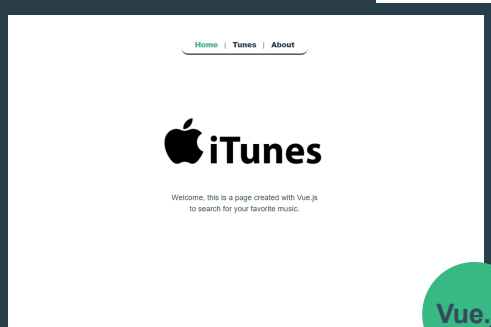

Digital Media Graphic Designer · (2011 - 2015)

## Projects

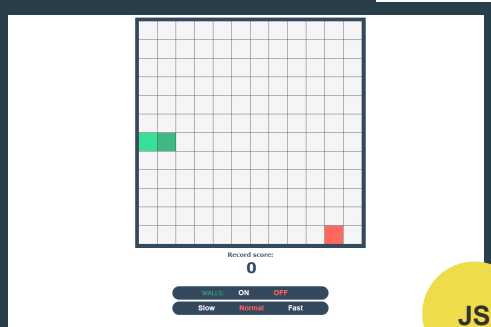

### API MARVEL App

With this application you can **search** your favorite **heroes** from the world of **MARVEL**, such as HULK, THOR or CAPTAIN AMERICA. You can **add** your favorite hero to the list of favorite heroes (then you can find them on the **FAVORITES** subpage) and a detailed description is displayed on the **HERO** subpage. The application was created in the **Vue.js** framework with **Vuex**.

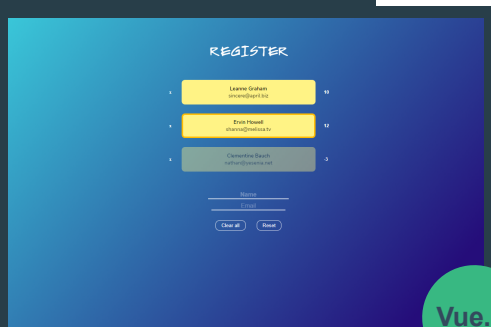

### API iTunes App

Application for searching your **favorite** songs using the **iTunes Search API**. With The Search API you can search for a variety of content within the iTunes Store and Apple Books Store but this application is focused on **songs**. The application was created in the **Vue.js** framework.

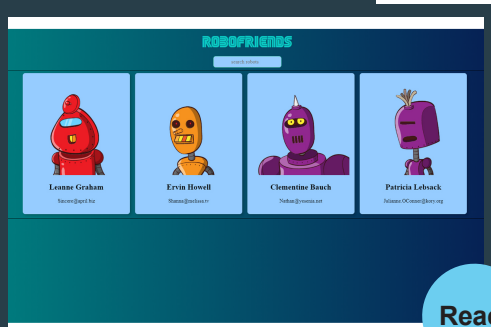

### Snake Game

This is the popular snake game created using **JavaScript**. The game offers **two** basic modes (on/off walls) and **three** speed levels. Control is **very simple** (arrows) and to **reset** the game using the backspace or other key. The game stores your record.

### Contact List

This is a very simple application created in my favorite framework: **Vue.js**. Here I learned the basics of Vue. The application contains inputs for **adding** new contacts, as well as buttons for **resetting**, **deleting** and **cleaning** the entire sheet.

### Robofriends

Everyone had to start somehow, and this was my first application created in the **React** framework. This is an easy search for saved contacts. Contacts are stored locally, but also contain settings with external data, via the axios interface.
